

Dym&D Asset Companion Feature Guide

Version 2.5.1

Dym&D Asset Companion is a Windows desktop tool for finding assets in large Forgotten Adventures and custom image libraries, then dragging the original full-resolution files into Clip Studio Paint. Its Browser supports broad discovery and precise filtering. Its Planner assembles coordinated wall, floor, detailing, and trim choices for a building project.

The application indexes source files in place. It does not move, rename, edit, or delete artwork in a registered library.

Artwork credit: Forgotten Adventures — <https://www.forgotten-adventures.net/>

Quick Start

1. Open **Dym&D Asset Companion**.
2. Choose **Add FA** and select your Forgotten Adventures _Assets folder. You may select _Assets itself or its parent folder.
3. Let the initial index finish.
4. Use **Browser** when you want to search the whole library.
5. Use **Planner** when you want a coordinated Walls, Floor, Detailing, and Trim palette.
6. Drag a tile into Clip Studio Paint to place its full-resolution image.

Later launches load the saved index instead of rescanning the complete library.

Compatibility requirement. Add FA is built for the standard Forgotten Adventures _Assets tree exactly as downloaded. Keep its folder names, nesting, filenames, and filename cadence intact. If that structure or cadence differs, expect FA-aware cataloging to break: assets may be missing or misclassified, wall sets may split, Planner results may be empty, and ribbon associations may be wrong or missing.

Screenshot note. The annotated images were captured during the 2.5.1 development cycle and may show the former Asset Browser label. The documented controls and layout are unchanged in Dym&D Asset Companion 2.5.1.

Artwork attribution. Interface screenshots display Forgotten Adventures artwork for identification and instructional commentary. The artwork belongs to Forgotten Adventures (<https://www.forgotten-adventures.net/>). Dym&D Asset Companion is an unofficial project and is not affiliated with or endorsed by Forgotten Adventures; no source asset files are distributed with it.

Browser

The Browser answers two questions at once: what kind of asset is this, and what does it look like or suit?

Classification Filters

The first three filters form a shallow hierarchy.

- **Category** is the broad domain, such as Construction, Nature, Food & Dining, or Furnishings & Objects.
- **Type** is the useful parent collection, such as Walls, Floors, Terrain, Openings, or Heating & Fuel.
- **Subtype** narrows that collection to a specific role, such as Wall Pieces, Cracks & Damage, Surfaces, or Firewood.

Choosing a broad Type can intentionally include several Subtypes. For example, **Walls** can show structural wall pieces, wall additions, and wall detailing in one pane. The results remain separated under named, collapsible headers.

Descriptive Filters

The remaining filters describe appearance and likely use.

- **Theme** narrows by visual setting or source theme, such as Arctic, Desert, Feywilds, or Underdark.
- **Material** identifies what an asset is made from, such as Adobe, Wood, Stone, Metal, or Glass.
- **Appearance** describes color, finish, or visual treatment, such as Sandstone, Ashen, Earthy, Frosty, or Rusty.
- **Scene / Use** retrieves assets by a practical job, such as Build: Wall Construction, Build: Wall Detail, Build: Floor Surface, Build: Roof Surface, Paint: Ground Surface, or a scene recipe such as Tavern Kitchen.

Material and Appearance can be multi-valued. A Brick and Wood wall can be found through either component instead of being hidden under one combined label.

The dropdowns are content aware. Each choice updates the values still available in the other filters. **All** is a valid choice at every level.

Advanced Filters

Open Advanced filters for two exact source-level controls. Source Folder / Set is the actual folder containing the asset, displayed with readable spacing. Filename Variant is the final letter-number design code in the filename, such as A1 or B12. These controls cascade with the primary filters, but they are usually unnecessary for ordinary browsing or Planner work.

Filename Search

Unquoted words are combined as order-independent terms. Every word must appear somewhere in the filename, but the words do not need to be adjacent or in the same order.

- Corner Ashen finds filenames containing both *Corner* and *Ashen*.
- Wall Red Wide finds filenames containing all three terms.

Quotation marks preserve a phrase as one exact, adjacent search term.

- "Corner_In" finds that exact filename phrase.
- Wall "Stone_Ashen" combines one broad term with one exact phrase.

Use **Case sensitive** only when capitalization must match. The small clear button at the right side of the search field removes the current filename query.

Result Sections

Results are grouped by their Category, Type, and Subtype path. Click a section heading to collapse or reopen that group. This is especially useful after selecting a broad virtual parent such as Walls or Food & Dining.

Working With Asset Tiles

Select and Inspect

Left-click a tile to select it. The selected filename appears above the result pane, and the tile receives a visible selection border. Hover over a filename to inspect the source path.

Selecting a Browser tile does not silently change the Planner recipe. Browser selection controls the active asset for transforms, copying, and dragging.

Rotate and Flip

Use the visible Transform controls or keyboard shortcuts after selecting a tile.

Action	Shortcut	Result
Rotate left	Q	Rotates the selected asset 90 degrees counterclockwise
Rotate right	E	Rotates the selected asset 90 degrees clockwise
Flip horizontally	F	Mirrors the selected asset from left to right

The tile preview and the image dragged into Clip Studio Paint use the same transform. The source artwork remains unchanged.

Artwork credit: Forgotten Adventures — <https://www.forgotten-adventures.net/>

Drag Into Clip Studio Paint

Drag a tile directly into Clip Studio Paint. With no transform applied, the application hands off the untouched original file. When a rotation or flip is active, it creates a full-resolution transformed copy in its local cache and drags that copy instead.

Copy a Foundry Path

Right-click an asset and choose **Copy filepath** when the command is available. The command copies a verified Foundry-friendly path relative to the configured Foundry Data folder. It remains unavailable when the application cannot prove that the path is valid for Foundry.

Planner

The Planner builds a reusable selection palette rather than a single flattened search result. It keeps four jobs separate:

Left column	Right column
Wall Pieces	Floor Textures
Detailing	Trim Set

The selector cards above the results use the same basic logic: choose the material, appearance, and theme that matter, and leave the rest at **All**.

Choose a Wall Set

Walls are selected as complete construction sets rather than as loose files. Start with **Wall System**, then choose the available component appearances. The controls adapt to the selected system.

- A single-material wall may show one appearance control, such as Adobe and Sandstone.
- A compound wall may show separate controls, such as Brick and Earthy plus Wood and Ashen.

- **Profile** carries meaningful construction distinctions such as Thin, Wide, or Sloped.
- **Variant** distinguishes genuinely separate sets after material and profile choices are applied.

While more than one set matches, the Planner shows one representative tile for each set. This is the wall-set window-shopping view. Left-click a representative tile to choose that exact set. The same results area then changes to the complete wall kit.

Choose a Floor

The Floor pane shows a bounded sample of matching square, repeating surface textures and reports the full matching total. Floor surfaces exclude plaques, inlays, grates, floor damage, and other placeable construction pieces.

Use Theme, Texture Set, Material, Appearance, and Variant to browse. Left-click a sample to choose that exact floor texture. Right-click a sample and use Filter Planner to keep browsing by one of its properties instead.

Artwork credit: Forgotten Adventures — <https://www.forgotten-adventures.net/>

If Floor is untouched and the chosen wall has an unambiguous compatible material and appearance, the Planner may seed those values as a helpful starting point. Once you edit Floor yourself, it remains independent.

Choose Trim

Trim is primarily a material and appearance choice. Its sample gallery includes compatible doors, frames, windows, sills, arches, shutters, gates, and similar openings.

Use Theme, Opening Type, Material, Appearance, and Variant to browse. Left-clicking a Trim sample selects its material and appearance family. It intentionally keeps all matching frame and opening variants instead of reducing the result to that one image. Right-click and choose Filter Planner to browse by a specific property such as Material, Appearance, Theme, Family (the underlying Opening Type), or Variant.

If Trim is untouched, an unambiguous wall material and appearance may seed it. Manual Trim choices remain independent afterward.

Wall Additions and Detailing

The completed palette separates structural members from compatible extras.

- **Wall Pieces** contains the path, straight pieces, corners, connectors, endings, junctions, and other members of the selected construction set.
- **Wall Additions** includes compatible structural inserts such as arrow slits and arched wall pieces.
- **Detailing** includes cracks, damage, loose pieces, rubble, overlays, decorations, and other assets that complement the selected wall without defining its ribbon.

A detail may belong to several wall sets. For example, one color family of Adobe cracks can appear for both Narrow and Wide Adobe walls.

Choosing the Arctic wall theme also makes reusable snow cover, snow edges, snow piles, and frost, snow, or ice overlays available in Detailing. These assets can add winter treatment to buildings that

do not have dedicated snowy artwork. Snow path ribbons, cracked ice, and blood remain in their own Browser categories.

Populate the Build

Use **Populate Build** when the wall, floor, and trim choices are ready. The Planner replaces the sample galleries with the final palette while preserving the two-column layout.

Use the small **reset** link beside Walls, Floor, or Trim to clear only that part of the recipe. Use **Start Over** to clear the entire Planner recipe and generated palette.

CSP Ribbon Associations

Each exact wall construction set owns one CSP ribbon association. The association applies to the complete set; corners, endings, details, and individual variants do not each need their own mapping.

After the Planner resolves one exact wall set, the ribbon strip displays its inferred or saved CSP Tool, Tool Group, and Ribbon values. Edit any incorrect value and choose Save for Wall Set. The assignment then applies to every structural piece in that set.

Detailing and Wall Additions do not affect ribbon resolution.

CSP organization. Dymnd does not inspect or change Clip Studio Paint. Ribbon should be the exact brush or sub tool name shown in CSP; no CSP file path is required. Tool and Tool Group describe where you keep that brush in your own CSP layout, so they can differ from the original FA organization.

Libraries and Indexing

Add and Manage Libraries

- **Add FA** registers a Forgotten Adventures _Assets folder and uses the FA-aware catalog rules.
- **Add Other** registers another image folder with the conservative generic parser.
- **Rename** changes the library's display name inside the application.
- **Remove** removes the library from the index. It does not delete or alter source files.

Use the library dropdown to view one registered source or the combined library view when available.

Forgotten Adventures Library Requirements

Unsupported if reorganized. The FA-aware catalog depends on both the official directory path and the filename to decide what an asset is, which wall set it belongs to, which details accompany it, and which CSP ribbon is likely to match. A file may still appear after its folders or name are changed, but the FA-specific result can be wrong or incomplete. The application does not repair or infer a replacement structure.

- Register **_Assets** itself or the folder directly above it.
- Keep the official FA folders and filenames exactly as supplied. Do not batch-rename, flatten, or move families between folders.
- If FA results become obviously wrong, restore the standard downloaded tree and run **Reindex Source**.

Experimental Custom Libraries

Experimental. Add Other can index a separate custom folder, but its generic classification is intentionally limited. Ordinary Browser searching and dragging are the most reliable custom-library features. Planner wall grouping, compatible detailing, and automatic CSP ribbon resolution may be incomplete or incorrect.

For the best chance of useful custom classification:

- Keep custom work in its own root and register it with **Add Other**. Do not mix experiments into the licensed FA tree unless you have a separate backup and accept that the result is unsupported.
- Use simple folder names such as Walls, Floors, Doors, Windows, Roofs, Furniture, Decor, Food, Kitchen, Terrain, or Water to provide broad context.
- Make the filename do most of the classification work. Use clear descriptive tokens separated by underscores, hyphens, or spaces. A practical pattern is function, material, appearance, variant, and size, for example **Wall_Stone_Ashen_A1_1x1.png** or **Floor_Wood_Dark_A1.jpg**.
- Prefer common material, appearance, and theme words already visible in the application's filters. Unknown terms remain Unspecified rather than becoming new taxonomy automatically.
- Use PNG, JPG, or JPEG files, then run **Reindex Source** and verify the result in Browser. Filename Search remains the dependable way to find a custom file that the parser cannot classify well.

Custom CSP Ribbon Information

If custom wall files successfully resolve to one Planner wall set, enter the exact CSP brush or sub tool name in **Ribbon**. That exact displayed name is the essential information; a CSP file path is not needed. Tool and Tool Group are optional organization notes that can match your personal CSP arrangement. Choose **Save for Wall Set** to retain the association. A ribbon mapping cannot repair custom files that were not first recognized as one coherent wall set.

Reindex

Use **Reindex Source** after files are added, removed, or updated in the selected library. Use **Reindex All** when several registered libraries have changed.

Reindexing rebuilds the local catalog from the files currently on disk. It does not modify the source library. Saved wall-set ribbon mappings are retained.

The local index, settings, ribbon mappings, transformed drag cache, and thumbnails are stored under %LOCALAPPDATA%\DymndAssetBrowser.

Practical Search Recipes

Find a Complete Wall Family

Open **Planner**, choose a Wall System, then choose its appearance, Profile, and Variant only as needed. Browse the representative set cards and left-click the set you want. Add Floor and Trim choices, then choose **Populate Build**.

Find Every Wall Related Asset

Open **Browser**, choose **Construction**, then choose the broad **Walls** Type. Leave Subtype at **All** to see structural pieces, additions, and detailing together under separate collapsible headings.

Build a Tavern Kitchen Asset Pool

Open **Browser** and choose **Tavern Kitchen** under **Scene / Use**. The result can cross ordinary object categories to include food, tableware, preparation tools, useful furniture, shelving, and storage. Add Material, Appearance, or Theme only when the result needs further narrowing.

Paint Natural Ground or Caves

For square repeating ground textures, use **Nature**, **Terrain**, and **Ground Surfaces**. For cave textures, use **Nature**, **Cave & Underdark**, and **Cave Surfaces**. Paths, ribbons, formations, and overlays remain in separate Subtypes so a surface search stays clean.

Add Snow to an Existing Building

In **Planner**, choose **Arctic** as the wall Theme and browse the Detailing section for snow edges and overlays. In **Browser**, use **Nature**, **Terrain**, and **Snow Cover & Edges** when you want the same assets outside a wall build.

Troubleshooting

A New Asset Does Not Appear

Choose the affected library, then run **Reindex Source**. Confirm that the file is inside the registered folder and uses PNG, JPG, or JPEG format.

A Search Returns Too Much

Add another Category, Type, Subtype, Material, Appearance, Theme, or Scene / Use filter. For filenames, add another unquoted term or place an exact phrase in quotation marks.

A Search Returns Nothing

Clear the most recent filter or choose **Reset Filters**. Because the dropdowns are content aware, an earlier choice may have removed combinations that do not exist in the current result set.

Dragging Uses the Wrong Orientation

Select the tile and check the Transform readout. Use Q or E to rotate and F to toggle the horizontal flip before dragging again.

A Wall Ribbon Needs Mapping

Narrow the Planner to exactly one wall set. Enter values that match your CSP organization; Ribbon must match the exact brush or sub tool name shown in CSP. Choose Save for Wall Set. Do not map a detail asset as though it were a separate construction set.

Copy Filepath Is Unavailable

The application enables **Copy filepath** only when it can verify a Foundry-friendly relative path. Confirm that the library is inside the configured Foundry Data folder or a recognized FA Nexus mirror.

Forgotten Adventures Results Look Wrong

Confirm that the registered source points to the untouched standard FA _Assets tree, then run **Reindex Source**. If folders or files were renamed or moved, restore the official downloaded structure first. Reindexing cannot correct a nonstandard FA layout.

Source Safety

Dym&D Asset Companion treats registered artwork as read-only. Indexing, filtering, thumbnail generation, rotation, flipping, removing a library, and Planner work do not alter the source files. The application stores its own working data separately under %LOCALAPPDATA%\DymndAssetBrowser.

Forgotten Adventures artwork is not included with the application. Use your own licensed library.
